Cisco SG 100D-08 Unmanaged Gigabit Switch with QoS Quick Start Guide

Package Contents

- Cisco SG 100D-08 Unmanaged Switch
- Wallmount Kit
- Power Adapter
- This Quick Start Guide

Welcome

Thank you for choosing the Cisco SG 100D-08 Unmanaged Switch, a Cisco Small Business network communications device.

This guide will familiarize you with the layout of the unmanaged switch and describe how to deploy the device in your network. For additional information, see www.cisco.com/smb.

Network Speed and Auto MDI/MDI-X Detection

All ports support network speed auto-negotiation and auto MDI/MDI-X crossover detection. Network speed auto-negotiation automatically selects the best connection speed and mode (half- or full-duplex) for communicating with attached devices. Auto MDI/MDI-X crossover detection automatically adjusts for the cable type (straight-through or crossover) used to connect the unmanaged switch to other devices.

Green Energy Savings Technology

Green Ethernet Technology saves energy by entering sleep mode on a Cisco SG 100D-08 port while there is no connection or the device connected to that switch port is turned off.

Traffic Prioritization

The Cisco SG 100D-08 delivers Quality of Service (QoS); all received packets are examined for QoS priority encoding. The switch reads the priority level and forwards the packet based on that priority level. For example, during heavy loads voice and video traffic are given priority over data traffic. (The switch is configured to comply with 802.1p, VLAN tagged frames.) This ensures that time-sensitive traffic gets the highest level of service.

1

Before You Begin

Make sure that you have the following equipment:

- Tools for installing the hardware
- Network cables to connect computers, printers, network storage, IP cameras, or other network devices.

2

Getting to Know the Cisco SG 100D-08

This section describes the exterior of the unmanaged switch.

Front Panel LEDs

The LEDs are located on the front panel of the switch.

System LED—(Green) This LED lights up and remains lit when the switch is powered on. When the LED is off, nothing is cabled to the port. Or there is a device connected to the port, but there is a problem with the cable or the connected device.

LEDs 1-8—(Green) Each LED lights up when a connection is made through its corresponding port. The LED flashes when the corresponding port is active.

Back Panel Ports

The Ethernet ports and the power port are located on the back panel of the unmanaged switch.

Ethernet Port—The unmanaged switch is equipped with auto-sensing, Ethernet (802.3) ports used for wired network communications. Auto-sensing technology enables each port to automatically detect the speed and duplex settings of the device connected to it, and adjust its speed and duplex settings to match the settings of the connected device. Each Ethernet port accepts an RJ-45 connector.

Side Panels

The security slot is where you can attach a Kensington lock to protect the switch from theft and is located on the right side of the unmanaged switch. The power switch is located on the left side of the unmanaged switch.

3

Installing the Cisco SG 100D-08

The unmanaged switch can be placed on a wall or a flat surface. Do not deploy the device in a location where any of the following conditions exist:

High Ambient Temperature—The ambient temperature must not exceed 104 degrees Fahrenheit (40C).

Reduced Air Flow—Both side panels must be unobstructed to prevent overheating.

Mechanical Overloading—The device should be level, stable, and secure to avoid it sliding or shifting out of position.

Circuit Overloading—Adding the device to the power outlet must not overload that circuit.

Wall Mounting

Before you begin, you need 2 wallboard screws to mount the unmanaged switch. We recommend using screws with a minimum of 0.16 inches (4mm) width at the head and a shaft diameter of at least 0.06 inches (1.5mm).

WARNING Cisco is not responsible for damages incurred by insecure wall-mounting.

To mount the unmanaged switch to the wall:

STEP 1 Determine where you want to mount the unmanaged switch. Verify that the surface is smooth, flat, dry, and sturdy.

STEP 2 Drill two pilot holes into the wall surface.

Cisco SG 100D-08: The screws should be 2.5 in. (63.5 mm) apart.

The wall-mount slots are two crisscross slots on the bottom panel of the unmanaged switch.

-
- STEP 3** Insert a screw into each hole, leaving a gap between the surface and the base of the screw head of at least 0.1 inches (3 mm).
- STEP 4** Place the unmanaged switch wall-mount slots over the screws and slide the unmanaged switch down until the screws fit snugly into the wall-mount slots.
- STEP 5** Connect the unmanaged switch to the other devices, as described in the **“Connecting the Equipment”** section.
-

Flat Surface Installation

To deploy the device on a desktop or other flat surface:

- STEP 1** Place the unmanaged switch on a desktop near an AC power source.
- STEP 2** Connect the unmanaged switch to the other devices, as described in the **“Connecting the Equipment”** section.
-

4

Connecting the Equipment

This section describes the process for connecting the device to the network.

STEP 1 Power down all of the devices you want to connect to the switch.

STEP 2 Connect the Ethernet cable to the Ethernet port of a PC, printer, network storage, or other network device.

NOTE We recommend using Cat5e or better cable. Also, do not exceed the maximum cabling distance of 328 feet (100 meters) per segment.

STEP 3 Connect the other end of the network Ethernet cable to one of the numbered unmanaged switch Ethernet ports.

STEP 4 Repeat **Step 2** and **Step 3** for each device you want to connect to the unmanaged switch.

CAUTION Make sure you use the power adapter included with the switch. Using a different power adapter might damage the switch.

STEP 5 Connect the power adapter to the power port on the back panel of the unmanaged switch.

STEP 6 Power up the devices connected to the switch. The LED of each active port on the switch lights.

NOTE To prioritize voice or video traffic by using the QoS feature on the Cisco SG 100D-08, set flow control to `off` in the configurations of the connected devices. Otherwise, flow control might send a pause frame to the switch, blocking the high-priority QoS packets queued on the port. On some devices, such as some IP phones and IP cameras, flow control might not be configurable.

5

Specifications

The following table lists the specifications for the Cisco SG 100D-08 Ethernet Switch.

Item	Specification
Model	Cisco SG 100D-08 Gigabit Switch with QoS
Standards	IEEE 802.3, 802.3u, 802.3ab, 802.1p, 802.3x
Ports	Eight RJ-45 10/100/1000 Mbps ports
Cabling Type	Category 5 Ethernet
LEDs	System, Link/Act 1 through 8
Security Feature	Security Slot
Dimensions (Width by Height by Depth)	5.51" by 1.31" by 5.51" 140 by 33.35 by 140 mm
Unit Weight	15 oz. (0.425 kg)
Power	DC12V/1.0A
Certification	FCC Class B, CE
Operating Temperature	32°F to 104°F (0°C to 40°C)
Storage Temperature	-4°F to 158°F (-20°C to 70°C)
Operating Humidity	10 to 90% Non-Condensing
Storage Humidity	10% to 90% Non-Condensing
